                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
high heat stability, thus sterilization in autoclaves can be performed conveniently. The current sequence is that of a cell attachment-related auxillary peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition useful for producing fibers or films, comprises hybrid multiblock copolymer derived from Nephila clavipes or Bombyx mori silks.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a novel composition (CI) comprising a hybrid multiblock copolymer. The multiblock copolymer comprise peptide linkers, which are derived from peptide sequences found in native silk biomacromolecules or the crystalline domains of Nephila clavipes or Bombyx mori silks. The present sequence is one such peptide linker. (Clis useful for producing films or fibers utilized in tissue-engineering scaffolds, cell culture substrates, biocompatible coatings, sutures, membranes, grafts and drug delivery systems. (CI) enables to produce fibers or films having increased stiffness and tensile strength.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                       Gaps

Beta sheet; circular dichroism spectroscopy; glycosidase activity; phosphodiesterase activity; drug screening; hydrolysis; neurodegenerative disease; Alzheimer's disease; amyloid deposition.

Beta-sheet forming peptide #2.

```
This sequence represents a specific example of a polypeptide, which forms a beta sheet in an aqueous environment and has the general formula a beta sheet in an aqueous environment and has the general formula con Jahmilkukmalln-NH2, in which A = D- or L-alanine amino acid, m. m2 = 0.40; ml+m2 = 10.40; J = a charged amino acid; n = 1 or 2; X = any amino acid except prolline; u = 0 or 1; J1 lysine, hydroxylysine, arginine, histidine, aspartic acid, glutamic acid or gamma-carboxyglutamic acid; Ac = an acylation modification to the carboxylic acid terminus; NH2 = an amidation modification to the carboxylic acid terminus; and X1 = cysteine, threonine, tyrosine or serine. The peptides have thosphodiesterase activity and readily hydrolyse nucleic acids. They also have glycosidase activity and readily hydrolyse sugar phosphates. Further they can cause amine-catalysed decarboxylation (e.g. decarboxylation of call constituents), and they can hydrolyse phospholipids. They can be used for screening drugs for the prevention or treatment of neurodegenerative diseases, e.g. Alzheimer's disease, which result in amplication deposition. They can also be used to screen for drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptide(s) which form stable beta sheets in aq. environment - having phosphodiesterase and glycosidase activity and useful in bio:engineering.enzymatic and drug screening applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2XXX2X
```

```
This sequence represents a specific example of a polypeptide, which forms a beta sheet in an aqueous environment and has the general formula unhaltvuma2n or A-11nam1xuma2n-NHF, in which A = D- or L-alamine amino acid; ml, m2 = 0.40; ml+m2 = 10-40; J = a charged amino acid; n = 1 or 2; x = any amino acid except proline; u = 0 or 1; J1 lysine, hydroxylysine, arginine, histidine, aspartic acid, glutamic acid or gamma-carboxyglutamic acid; Ac = an acylation modification to the amino terminus; NH2 = an amidation modification to the carboxylic acid terminus; and X1 = cysteine, threonine, tyrosine or serine. The peptides have phosphodiesterase activity and readily hydrolyse nucleic acids. They also have glycosidase activity and readily hydrolyse sugar phosphates. Further they can cause amine-catalysed decarboxylation (e.g. decarboxylation of oxalacetate), and they can hydrolyse phospholipids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polypeptide(s) which form stable beta sheets in aq. environment - having phosphodiesterase and glycosidase activity and useful in bio:engineering.enzymatic and drug screening applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            bioengineering, enzymatic and drug screening applications. In particular they can be used for screening drugs for the prevention or treatment of neurodegenerative diseases, e.g. Alzheimer's disease, which result in amyloid protein deposition. They can also be used to screen for drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                  The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of G1y and Ala in (Y) is 42-100% with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, hormones and antibiotics. Furthermore, the polypeptide may be useful for
                                                                                                                                                                                                                                                                                                                                                                                             culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The polypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits high heat stability, thus sterilization in autoclaves can be performed conveniently. The current sequence is that of a cell attachment-related auxillary peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                 Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence,
           cell attachment; cell culture; transplantation; vaccine; antibiotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Beta sheet, circular dichroism spectroscopy; glycosidase activity, phosphodiesterase activity; drug screening; hydrolysis; neurodegenerative disease; Alzheimer's disease; amyloid deposition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

This sequence represents a specific example of a polypeptide, which forms a beta sheet in an aqueous environment and has the general formula and the abeta sheet in an aqueous environment and has the general formula and the abeta sheet in an aqueous environment and has the general formula and the acid, ml.m2 = 10-40; J = a charged amino acid; n = 1 or 2; x = any amino acid except proline, u = 0 or 1; J1 lysine, hydroxylysine, arginine, histidine, aspartic acid, glutamic acid or gamma-carby, Ac = an acylation modification to the amino cramboxylutamic acid, Ac = an acylation modification to the carboxylic acid terminus; NH2 = an amidation modification to the carboxylic acid terminus; and X1 = cysteine, threonine, tyrosine or serine. The peptides have bosphodiesterase activity and readily hydrolyse nucleic acids. They also have glycosidase activity and readily hydrolyse sugar phosphates. Further they can cause amine-catalysed decarboxylation (e.g. decarboxylation of coxalacetate), and they can hydrolyse phospholipids. They can be used for screening applications. In particular they can be used for screening applications or treatment of neurodegenerative diseases, e.g. Alzheimer's disease, which result in amiliar in the contraction and protein and prot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polypeptide(s) which form stable beta sheets in aq. environment - having phosphodiesterase and glycosidase activity and useful in bio:engineering.enzymatic and drug screening applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homeobox gene, ARX; ARX-related disorder; X-linked myoclonic epilepsy; infantile spasm; mental retardation; Partington syndrome; diagnosis; dystonia; human; mutant; mutein.

                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Silk; genetically modified; silk-like protein; polymer; silkworm fibroin; elastin; fibronectin; textile; food; industry; cosmetics; pET-SLP(n); pET-SLP(2; 4; 6); SLP6.
                                                                                                                                                                              The invention relates to human orthologue of Aristaless homeobox gene, ARX. ARX gene is associated with infantile spasms (IS), non-specific X-linked mental retardation, X-linked myoclonic epilepsy and Partington syndrome. ARX gene is useful for diagnosing ARX-related disorders e.g., mild mental retardation, infantile spasms or dystonia. The present sequence is human ARX (GCG)10+7 mutant cDNA fragment encoded peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mass production of silk protein and silk-like protein having imparted function by employing genetically-modified Escherichia coli, useful in textiles, food industry and cosmetics.
                                                                                                                         New ARX gene, useful for diagnosing ARX-related disorders e.g., mild mental retardation, infantile spasms or dystonia.
                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                        ADH58940
                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                          요
```

The invention relates to a method for producing silk or genetically-modified silk-like protein, comprising designing a silk or silk-like polymer containing e.g. domesticated silkworm fibroin and synthesizing

```
the minimum unit of the silk or the thus designed polymer for integration into expression vectors and transfer into Escherichia coli prior to growing in a medium. Also disclosed is a method for producing silk or certainty and silk-like protein, comprising designing a silk or silk-like polymer containing at least one protein selected from certainced silkworm fibroin, wild silkworm fibroin, elastin and Cf fibronectin and essentially comprising the domesticated from cf fibronectin and essentially comprising the domesticated or wild silkworm fibroin. The produced silk and silk-like protein are useful in textiles, food industry and cosmetics. Using this method, expression efficiency is greatly improved, thus providing silk-like protein with designed functionallities easily in large quantities. The SLP gene, PUC-link and SLP(n) were constructed for producing expression vector pEr-SLP(n) with cexpression of pET-SLP(2,4,6). The target protein SLP6 was obtained after CC cleavage of the tag sequence with use of cyanogens bromide. The sequences given in records for ADHS8932-ADHS8971 represent silk-like protein creation of the vector of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a method for mass production of silk protein and gene recombinant silk-like protein (SLP). The method involves integrating a silk like polymer selected from e.g. domestic silkworm fibroin, wild silkworm fibroin, elastin and fibronectin of the minimum unit into an expression vector selected from expression vectors containing T7 promoter. The method is useful for mass producing silk or silk-like proteins with improved cellular adhesiveness, elasticity or hardness and is also useful in clothing, food and cosmetic industries. The present sequence is a polyalanine peptide which is similar to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing silk or silk-like protein comprises integrating a silk like polymer comprising the minimum unit into an expression vector selected from expression vectors containing T7 promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala mino 3-2-1003 with cacids and the sum total content of Gly and Ala mino 3-2-1003 with crespect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, hormones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The collypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base convention and methods. The polypeptide also exhibits for material, relative to conventional methods. The polypeptide also exhibits conveniently. The current sequence is that of a cell attachment-related conveniently. The current sequence is that of a cell attachment-related auxillary peptide of the invention.
                                                                                                                                              cell attachment; cell culture; transplantation; vaccine; antibiotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cell adhesion property polypeptide auxiliary amino acsequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cell adhesion; cytokine; hormone; antibiotic; heat tolerance.

0
polyalanine region in wild silk worm and is used in the formation of SLPA (Silk-like protein with polyalanine).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human orthologue of Aristaless homeobox gene, ARX. ARX gene is associated with infantile spasms (IS), non-specific X-linked mercal retardation, X-linked myoclonic epilepsy and Partington syndrome. ARX gene is useful for diagnosing ARX-related disorders e.g., mild mental retardation, infantile spasms or dystonia. The present sequence is human ARX 428-451dup(24bp) mutant cDNA fragment encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Homeobox gene; ARX; ARX-related disorder; X-linked myoclonic epilepsy; infantile spasm; mental retardation; Partington syndrome; diagnosis; dystonia; human; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                           ;
                                                                                                                                                                               The invention relates to a novel polypeptide having cell adhesion property. The polypeptide comprises a minimum amino acid sequence and an auxiliary amino acid sequence capable of expressing a cell adhesion property and having a molecular weight of 1500-15000. The invention further comprises a cell adhesion property polypeptide base material. The cell adhesion property polypeptide base material is useful for producing a cell. The cell adhesion property polypeptide is useful for culturing and analyzing cells, screening assays, and producing bloactive substances such as cytokines, hormones, antibiotics, etc. The cell adhesion property polypeptide has excellent cell adhesion property, heat stability and has low immunogenicity. This sequence represents a human adhesion property polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hepatitis A virus; HAV; immunogen; immunostimulant; virucide; vaccine; antigen; major structural capsid polypeptide; HAV antibody detection.
                                                                                                                                  polypeptide having cell adhesion property, useful for culturing
                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                             ;

The present sequence is one of a number of synthetic peptides which are immunoreactive with hepatitis A virus (HAV) antibodies. The peptides comprise antiquence epitopes of the major structural capsid polypeptides or non-structural polypeptides of HAV with one or more glutamine con accuses at the carboxy end of the peptide. The peptides are used to detect the presence of antibodies against HAV in mammalian serum, to caect the presence of HAV in a human or animal through the binding of the peptide to an antibody, to detect acute phase infection by detecting cy antibodies in mammalian serum and detecting convalescence in a mammal. The peptides are used to detect or quantify HAV antibodies in samples in clinical or research-based assays using immunoblotting, fluorescence in situ hybridisation analysis, gel-mobility shift assays, tracking of radioactive or bioluminescent markers, chromatography or electrophoresis. The peptides are used to induce an immune response to HAV when administered to a human or animal. Glutamine at the carboxy end the peptides enhances the IgM antibody reactivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   lung cancer; tumour; cytostatic; immunostimulant; vaccine; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel compositions and methods for the therapy and diagnosis of cancer, particularly lung cancer. The invention relates to a method for producing silk or genetically-
modified silk-like protein, comprising designing a silk or silk-like
protein, comprising designing a silk or silk-like
polymer containing e.g. domesticated silkworm fibroin and synthesizing
the minimum unit of the silk or the thus designed polymer for integration
into expression vectors and transfer into Bscherichia coli prior to
growing in a medium. Also disclosed is a method for producing silk or
growing in a medium. Also disclosed is a method for producing silk or
silk-like polymer containing at least one protein selected from
constituted silk-like protein, wild silkworm fibroin, elastin and
fibroin. The produced silk and silk-like protein are useful in textiles,
food industry and cosmetics. Using this method, expression efficiency is
greatly improved, thus providing silk-like protein with designed
functionalities easily in large quantities. The SLP gene, PUC-link and
                                                                                                                                                                                                                                                                                                                            ö
comprise one or more lung tunmour polypeptides, immunogenic portions therof, polymucleotides that encode such polypeptides, antigen presenting cells that express such polypeptides, and T cells that are specific for cells expressing such polypeptides. The novel compositions have cytostatic and immunostimulant activity. The lung tunmour antigens can be used in the creation of a vaccine. The polymucleotides that encode the lung tunmour polypeptides can be used in gene therapy to help in the treatment of lung tunmours. This sequence represents a human lung tumour clone polypeptide of the invention. This sequence was not shown in the specification. It has been taken from a World Intellectual Property
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Silk; genetically modified; silk-like protein; polymer; silkworm fibroin; elastin; fibronectin; textile; food; industry; cosmetics; pET-SLP(n); pET-SLP(2; 4; 6); SLP6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mass production of silk protein and silk-like protein having imparted function by employing genetically-modified Escherichia coli, useful in textiles, food industry and cosmetics.
                                                                                                                                                                                                                                                                                                                            Gaps

SLP(n) were constructed for producing expression vector pET-SLP(n) with expression of pET-SLP(2,4,6). The target protein SLP6 was obtained after cleavage of the tag sequence with use of cyanogens bromide. The sequences given in records for ADH58932-ADH58971 represent silk-like protein related polypeptides and polynucleotides, and primers used in the creation of the vector of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vedvick TS;

The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various caperiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, or useful substances such as cytokines, thrombolytic agents, vaccines, or culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The polypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as Nibra and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits high heat stability, thus sterilization in autoclaves can be performed conveniently. The current sequence is that of a cell attachment-related
sequence chosen from any one of 40 lung tumour polypeptides or its complements, fragments or degenerate variants. The method of the invention has cytostatic applications and may be useful for detecting and treating lung cancer in a patient, as well as for inhibiting the development of lung cancer in a patient via incubating CD4+ and/or CD8+ cells isolated from a patient with at least one component chosen from a polypeptide, polynucleotide or antigen presenting cell (APC) of the invention and administering an effective amount of the proliferated reals to the patient. The current sequence is that of the human lung cancer-related peptide of the invention. The current sequence is not shown in the specification per se but is available on the USPTO web-site http:seqdata.uspto.gov/sequence.html?DocID=20030211510.
                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cell attachment; cell culture; transplantation; vaccine; antibiotic.

The present invention provides a method for mass production of silk protein and gene recombinant silk-like protein (SLP). The method involves integrating a silk like polymer selected from e.g. domestic silkworm fibrolin, wild silkworm fibroin, elastin and fibronectin of the minimum unit into an expression vector selected from expression vectors containing T7 promoter. The method is useful for mass producing silk or silk-like proteins with improved cellular adhesiveness, elasticity or hardness and is also useful in clothing, food and cosmetic industries. The present sequence is a silk-like protein with polyalanine (SLPA)
                                                                                    ö
                                                                                                                                                                                                                                                                                                           Domestic silkworm silk-like protein with polyalanine peptide SEQ ID: 24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Producing silk or silk-like protein comprises integrating a silk like polymer comprising the minimum unit into an expression vector selected from expression vectors containing T7 promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present sequence is one of a number of synthetic peptides which are immunoreactive with hepatitis A virus (HAV) antibodies. The peptides comprise antigenic espitopes of the major structural apsid polypeptides of the major structural apsid polypeptides of HAV with one or more glutamine connected to a number of the peptide. The peptides are used to detect the presence of antibodies against HAV in mammalian serum, to detect the presence of AHAV in a human or animal through the binding of the peptide to an antibody, to detect acute phase infection by detecting in mammalian serum and detecting convalescence in a mammalian serum and detecting convalescence in a mammalian serum and actecting convales in clinical or research-based assays using immunoblotting, fluorescence in situ hybridisation analysis, gel-mobility shift assays, tracking of radioactive or bioluminescent markers, chromatography or electrophoresis. The peptides are used to induce an immune response to HAV when administered to a human or animal. Glutamine at the carboxy end of the peptides enhances the IgM antibody reactivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        miniblock polymer; optical response; mid infrared wavelength range; long range ordered fluid; liquid crystals; nanolithography; tresensitive device; If sensor; II filter; night telescope; thermosensitive detector; non-linear chromophore; biomaterial; tissue engineering scaffold; ferroelectric material; artificial muscle;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes the production of a novel synthetic DNA (1), wf8r, encoding an antifreeze polypeptide, AFPWF8R modelled on the antifreeze peptide (AFP) found in winter flounder. The polypeptides encoded by (1) lower the freezing temperature of water and prevent ice formation, therefore are useful as antifreeze agents. The use of synthetic peptides is less toxic than the use of chemicals (prior art). Naturally occurring antifreeze polypeptides are not available in large quantities, synthetic antifreeze polypeptides are more readily available. The antifreeze polypeptides are produced by recombinant means, a process which is cheaper and less time consuming compared to direct chemical synthesis of synthetic peptides (prior art)
                                                                                                                                                                                                          Antifreeze peptide; AFP; wf8r; AFPWF8R; winter flounder; ice formation; water freezing temperature; antifreeze agent.

The invention relates to a miniblock polymer (I) comprising a self-
fabricating block and a solubilizing block, a block for triggering self-
ce fabrication by external or environmental conditions, and a block for
incorporating turns in the polymer or for providing sites for chemical
conformations, has a molecular weight of 1000-300000 and, in solution,
can self-fabricate to form 3-dimensional material having long-range
corder, and where (I) has glycine content of at least 20%. (I) is useful
for controlled delivery of a drug which involves incorporating acro
corterial. (II), and administering the self-fabricating material incorporating
the drug. The drug is incorporated within layers of the self-fabricating
content of mid infrared wavelength range which involves applying (II)
contents, which can then undergo very specific structural transitions to
cor forms, which can then undergo very specific structural transitions to
cor forms, which can then undergo very specific structural transitions to
cor forms, which can then undergo very specific structural transitions to
cor forms, which can then undergo very specific structural transitions to
cor forms, which can then undergo very specific structural transitions to
cor forms, which can then undergo very specific structural transitions to
cor forms, which can then undergo very specific structural transitions to
cor forms, which can then undergo very specific structural transitions to
corporated fabricated fransitive devices.

(I) is useful for preparing chemically patterned templates with either
copolymer (II) is useful for modifying and improving performance of IR-
condition, and in optical applications e.g., as matrices to align non-
condition, and in optical applications e.g., as matrices to align non-
linear chromophores which are useful in creating materials for second
coder non-linear orbites. (II) is useful in dreating materials are contained are strictly and contained are strictly and contained are useful in creating materials, second
contains an expecific des
                                                                                                                                                                                                   Miniblock polymer useful in nanolithographic processes, has self-fabricates fabricating block and solubilizing block, has glycine and self-fabricates to form 3-dimensional materials having long-range orders, in solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               miniblock polymer; optical response; mid infrared wavelength range; long range ordered fluid; liquid crystals; nanolithography; IR-sensitive device; IR sensor; IR filter; night telescope; thermosensitive detector; non-linear chromophore; biomaterial; tissue engineering scaffold; ferroelectric material; artificial muscle;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ferroelectric materials, artificial muscles, switching devices, et sequence represents a peptide used in the method of the invention

The invention relates to a minibility block, a block for triggering self-
dabricating block and a solubilizing block, a block for triggering self-
fabrication by external or environmental conditions, and a block for
fabrication by external or environmental conditions, and a block for
incorporating turns in the polymer or for providing sites for chemical
can self-fabricate to form 3-dimensional material having long-range
corder, and where (1) has glycine content of at least 20%. (1) is useful
corder, and where (1) has glycine content of at least 20%. (1) is useful
corder, and administering the self-fabricating material incorporating
corder, and administering the self-fabricating actual
corder, and administering the self-fabricating actual
corder. The drug is incorporated within layers of the self-fabricating
corder and infrared wavelength range which involves applying (1)
corder to mid infrared wavelength range which involves applying (1)
corder to mid infrared wavelength range which involves applying (1)
corder surface of the device (all claimed). (1) is useful for preparing
corder fluids (i.e., liquid crystal) in a variety of phases
corder range ordered fluids (i.e., liquid crystal) in a variety of phases
corder ranged materials. (1) can be used as structural transitions to
corder ranged processes. A self-fabricated structure containing the
corder rangely of processes. A self-fabricated structure containing the
colymer (II) is useful for modifying and improving performance of IR-
continger (II) is useful for modifying and improving performance of the modifying and improving performance of the modifying and improving performance of IR-
contingerial devices, IR sensors, IR filters, night telescopes and
continge that absorb specific wavelengthes of infrared
contingent than the contingent in a contingent maniform of the modifying and contingent in a contingent maniform or a self-fabricated arructure or and administration or contingent maniforms. (II) as a martine devices and a manifold of the contingent in a conti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   devices, etc. This
                                                                                                                                                                                                                                                                                                                                                                                                                                      Miniblock polymer useful in nanolithographic processes, has self-fabricates fabricating block and solubilizing block, has glycine and self-fabricates to form 3-dimensional materials having long-range orders, in solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     radiation, and in optical applications e.g., as matrices to align non-
linear chromophores which are useful in creating materials for second
order non-linear orbits. (II) is useful in hydrogen catalysis, as
coatings for biomaterials, scaffolds for tissue engineering,
ferroelectric materials, artificial muscles, switching devices, etc. The
sequence represents a peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with caids and the sum total content of Gly and Ala in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, cueful substances such as cytokines, thrombolytic agents, vaccines, or useful substances such as cytokines, the polypeptide may be useful for culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The collypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base catach relative to conventional methods. The polypeptide also exhibits conveniently. The current sequence is that of a cell attachment-related auxillary peptide of the invention.
                                                                                                                                                                     Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence, alternatively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cell attachment; cell culture; transplantation; vaccine; antibiotic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100$ with cacids and the sum total content of Gly and Ala in (Y) is 42-100$ with crespect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various caperiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, hormones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The polypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits conveniently. The current sequence is that of a cell attachment-related conveniently. The current sequence is that of a cell attachment-related auxillary peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

an auxiliary amino acid sequence (X) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100\$ with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines, commones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The polypeptide exhibits extremely potent cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits high heat stability, thus sterilization in autoclaves can be performed conventiently. The current sequence is that of a cell attachment-related auxillary peptide of the invention. The invention relates to a novel cell attachable polypeptide comprising Disclosure; SEQ ID NO 55; 20pp; Japanese.

Cell attachable polypeptide useful for culturing cell, comprises auxiliary amino acid sequence having specific amount of Gly and Ala, chemically bonded to cell attachable minimal amino acid sequence, alternatively.

Disclosure; SEQ ID NO 56; 20pp; Japanese.

The invention relates to a novel cell attachable polypeptide comprising an auxiliary amino acid sequence (Y) chemically bonded to a cell attachable minimal amino acid sequence (X), where (Y) contains 1-50 amino acids and the sum total content of Gly and Ala in (Y) is 42-100% with respect to the total number of amino acids in (Y). The polypeptide of the invention may be utilized during culturing of cells for use in various experiments, including toxicity studies, gene transfer and production of useful substances such as cytokines, thrombolytic agents, vaccines,

hormones and antibiotics. Furthermore, the polypeptide may be useful for culturing cells for transplantation, particularly, transplantation of skin, cranial bones, muscles, skin tissue, bone marrow and retina. The polypeptide exhibits extremely potent cell adhesion properties and can attach cells, such as NHDF and VERO cells, more efficiently onto a base material, relative to conventional methods. The polypeptide also exhibits high heat stability, thus sterilization in autoclaves can be performed conveniently. The current sequence is that of a cell attachment-related auxillary peptide of the invention. 888888888888

ö New isolated peptide and fusion peptide, useful for inserting proteins peptides and nucleic acids into the cell membrane in vivo or in vitro that may be useful in treating cancer or other proliferative disorders, e.g. psoriasis. 

Claim 5; Page 62; 111pp; English.

The invention relates to an isolated peptide used in compositions for expressing a composite receptor on the cell surface. The peptide is a fusion peptide comprising at least one cell penetrating domain which is linked to at least one transmembrane domain or to an adapter domain capable of binding to a molecule, where the orientation of the cell penetrating domain is independent of the orientation of the transmembrane or adapter domain. The peptides are useful for inserting proteins or peptides such as regulatory factors, enzymes, antibodies, drugs or toxins and nucleic acids such as DNA or RNA into the cell membrane either in vivo or in vitro, that may be useful in inhibiting or treating diseases or disorders, which could benefit from the addition of surface receptors to cells, such as cancer and other proliferative disorders like psoriaais and cystic fibrosis. The methods are useful for identifying agents that modulate the activity of a receptor protein and for preparing the fusion

```
The invention relates to a miniblock polymer (I) comprising a self-
fabricating block and a solubilizing block, a block for triggering self-
fabrication by external or environmental conditions, and a block for
incorporating turns in the polymer or for providing sites for chemical
modifications, has a molecular weight of 1000-300000 and, in solution,
can self-fabricate to form 3-dimensional material having long-range
order, and where (I) has glycine content of at least 20%. (I) is useful
for controlled delivery of a drug which involves incorporating a drug
within (I), and administering the self-fabricating material incorporating
corporating. The drug is incorporated within layers of the self-fabricating
material. (II) is useful for modifying the optical response of a device
in the near to mid infrared wavelength range which involves applying (II)
co the surface of the device (all claimed). (I) is useful for preparing
long range ordered fluids (i.e., liquid crystals) in a variety of phases
or forms, which can then undergo very specific structural transitions to
form rigid materials. (I) can be used as structural trissue implants, in
claying crystal displays, and for producing high-performance composites.
(I) is useful for preparing chemically pattend templates with either
general features are specific features. (I) is also useful in
nanolithographic processes. A self-fabricated structure containing the

polymer (II) is useful for modifying and improving performance of IR-sensitive devices, IR sensors, IR filters, night telescopes and thermosensitive detectors. (II) can be used for preparing films, membranes or coatings that absorb specific wavelengths of infrared radiation, and in optical applications e.g., as matrices to align nonlinear chromophores which are useful in creating materials for second order non-linear orbits. (II) is useful in hydrogen catalysis, as coatings for blomaterials, scaffolds for tissue engineering, ferroelectric materials, artificial muscles, switching devices, etc. The sequence represents a peptide used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ad3362
homeotic protein Hox D8 - mouse
NyAlternate names: homeotic protein Hox 4.3
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Date: 11-Dec-1992 #sequence_revision 11-Dec-1992 #text_change 09-Jul-2004
C;Accession: A43562

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A;Cross-references: UNIPROT:Q9H1B7; UNIPARC:UPI00000738BA; GB:AJ277365
C;Comment: This protein, a proline-rich nuclear protein, functions as a transcriptional
s and undergoes rapid degradation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C;Species: Neurospora crassa

"Characterization of ribosomal phosphoprotein P0 of Eimeria tenella.";
"Characted (FEB-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Ribosomal protein P0 is the functional equivalent of
E.coli protein L10.
-!- SUBUNIT: P0 forms a pentameric complex by interaction with dimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Galagan J.E., Calvo S.E., Cuomo C., Ma L.-J., Wortman J.R.,

By E16.5 levels are diminished and restricted to unfused pockets along the exhausted ventricular zone.
                                                                                                                                                                                                                                                                                                                       07-FEB-2006, entry version 39.
Forkhead box protein D1 (Forkhead-related protein FKHL8) (Forkhead-related transcription factor 4) (FEBAC-4) (Brain factor-2) (HFH-BF-2) Name=Foxdl; Synonyms=Fkhl8, Freac4, Hfhbf2;
                                                                                                                                                                                                                                                                                                                                                                                                               Mus musculus (Mouse).

DEVELOPMENTAL STAGE: At B9.5 embryos, expressed in a limited region of the neuroepithelium and also in the temporal half of the primary optic cup and the optic stalk. At E10.5, seen in the hypothalamus, temporal half of the optic stalk, and temporal half of the optic stalk, and temporal regions of condensed mesenchyme of the head, and as neuroepithelial cells begin to differentiate and migrate outward

Pierrou S., Hellqvist M., Samuelsson L., Enerbaeck S., Carlsson P.;
"Cloning and characterization of seven human forkhead proteins:
binding site specificity and DNA bending.";
-1. FUNCTION: Transcription factor required for formation of
positional identity in the developing retina, regionalization of
the optic chiasm and morphogenesis of the kidney (By similarity).
-1. SUBCELLULAR LOCATION: Nucleus.
-1. SIMILARITY: Contains 1 fork-head DNA-binding domain.
                                                                                                                                                                                                                                                                                                                                               FOXD1 HUMAN STANDARD, PRT, 465 AA. 016676; Q12949; OLNOV-1997, integrated into UniProtXB/Swiss-Prot. 01-NOV-1997, sequence version 1. 01-NOV-1997, sequence version 1. 00-FBB-2006, entry version 3. Forkhead box protein D1 (Forkhead-related protein FKHL8) (Forkhead-related transcription factor 4) (FRBAC-4).

Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
--- FUNCTION: May be involved in transcriptional regulation.
--- SUBCELLIULAR LOCATION: NUCleus (Potential).
--- SIMILARITY: Contains 1 BTB (POZ) domain.
--- SIMILARITY: Contains 2 C2H2-type zinc fingers.
